

We will produce any shape pack to your requirements. The cost is £6 plus the cost of the single cells required. A rough sketch or example of the configuration will be required.

We use pure 100% nickel strips for linking our cells, not nickel plated steel. All the joints of attachment to the cells are capacitor discharge resistance welded in milliseconds. This conforms to manufacturers best practice recommendations. For solder connections, such as wire connections, we use non corrosive flux and high grade solder. On power packs there is insulation on all the major joints and this is with either Kapton or Nomex, both resistant to 200°C. This reduces the risk of the China Syndrome, where the whole pack shorts out as a result of insulation failure on a single cell through damage, excess heat or being shorted out.
